

TOKENIZED EXPOSURE, COMPOSED ONCE

HOLD & PAIR AS ONE

Xindex turns several tokenized stock exposures into one liquid basket asset, designed for a simpler wallet, a clearer product, and more useful liquidity.

**Deposit USDG.
Get one basket.
Hold, trade, pair.**

XINDEX WHITEPAPER

Product architecture and launch thesis

A PRODUCT-LED PATH
TO COMPOSABLE
MARKET EXPOSURE ON
ROBINHOOD CHAIN.

 Baskets are the
product

ONE IDEA. THREE PRODUCTS.

The market already offers individual tokenized stock exposures. Xindex proposes the missing product layer: a basket token that packages several exposures into one balance users can hold, trade, redeem, and use as a liquidity pair.

“The goal is not more tickers. The goal is **one useful asset that represents a deliberate set of exposures.”**

01

basket balance from a USDG
deposit

A vault flow with explicit estimates

05 Pairing as a primitive

Why a basket is a better liquidity counterpart

06 Product before token

A fee engine that follows adoption

07 Canonical references

Contract discipline and user-facing clarity

08 Roadmap & risks

A measured path from concept to protocol

LESS WALLET MANAGEMENT. MORE PRODUCT.

Tokenized markets make individual exposures more portable. They do not automatically make a multi-asset strategy easier to use. If a user wants seven exposures, they still inherit seven balances, seven decisions, and seven possible liquidity paths.

The wallet clutter problem

A portfolio can be diversified in theory and still feel fragmented in practice. Separate tickers create operational friction at every step: acquiring exposure, monitoring it, moving it, pairing it, and exiting it.

01

Many references

Several tokenized stocks represent the exposure a user wants.

02

Many balances

Each ticker becomes another position to manage and explain.

03

One answer

A basket token composes the set into a single product.

THE XINDEX ANSWER

One liquid basket token.

Deposit USDG and receive a token that represents a defined basket. Hold it as one position, trade it as one asset, or use it as one side of a liquidity pair.

Example

**\$AI7 = NVDA +
AVGO + TSM +
AMD**

The product thesis

The value is not only in the underlying references. It is in the packaging: a fixed, legible composition that can move through a wallet, a vault, or a liquidity pool without asking the user to recreate the same allocation every time.

COMPOSE ONCE. USE EVERYWHERE.

A basket is a product with a defined composition, a mint/redeem path, and a market role. It is not a promise that every underlying asset behaves the same way, nor a replacement for understanding the references inside it.

01

Reference catalogue

Start with canonical Robinhood Stock Token references and a published composition.

02

Basket definition

Express the intended exposure as one named product with transparent weights.

03

Vault interface

Let users simulate or execute a deposit, mint, redeem, and fee path.

04

Liquidity role

Use the basket as an asset that other projects can pair against.

What a basket standardizes

LAYER	WHAT IS DEFINED
Identity	Name, symbol, and product purpose
Composition	Underlying references and target weights
Conversion	Deposit and redemption relationship
Market role	An asset that can be held, traded, or paired
Disclosure	Estimates, execution limits, and risks shown plainly

DESIGN RULE

Make the wrapper legible.

A user should understand what a basket contains before deciding whether to hold it. A project should understand what it is pairing against before bootstrapping liquidity.

IMPORTANT DISTINCTION

Reference prices and weights describe the product. They are not a guarantee of execution price, liquidity, or future performance.

START NARROW. EARN THE RIGHT TO EXPAND.

Xindex begins with three focused basket products. The initial catalogue is intentionally small: each product should be easy to identify, easy to simulate, and easy to use in a market.

\$AI7

AI Compute

A focused basket for the AI hardware stack.

NVIDIA / NVDA	35%
Broadcom / AVGO	25%
TSMC / TSM	25%
AMD / AMD	15%

Illustrative composition shown for the product concept.

\$MAG7

Magnificent Seven

Seven mega-cap technology leaders in one balanced basket.

Apple / AAPL	14.3%
Microsoft / MSFT	14.3%
Alphabet / GOOGL	14.3%
Amazon, NVIDIA, Meta, Tesla	57.1%

Illustrative equal-weighted concept; final product parameters may change.

\$GOLD

Gold- Linked

Gold-linked exposure through a verified reference in the catalogue.

GOLD

Gold-linked Robinhood contract **100%**

Gold-linked exposure is not described as physical reserve backing.

Future catalogue: additional concepts may be explored later. They are not part of the initial three basket products.

Why only three?

A smaller catalogue makes the first user experience easier to explain and gives liquidity efforts a clear starting point. Expansion should follow demand, usage, and the quality of the underlying references.

PRODUCT TEST

Can a new user name the basket, describe what it holds, and understand what they can do with it in one sentence?

THE VAULT IS THE CONVERSION LAYER.

The vault turns a USDG deposit into a basket balance and gives a holder a path back out. The interface should make the allocation, estimate, fee, and simulation status visible before action.

Mint flow

- ✓ **Choose a basket.** Select one of the initial products and review its composition.
- ✓ **Enter a USDG amount.** The interface shows the fee and an estimated basket output.
- ✓ **Review before action.** The user sees the reference value, target weights, and simulation disclosure.
- ✓ **Receive the basket.** In a live implementation, the vault would execute against the approved contract path.

REDEEM FLOW

Select a basket amount, review the estimated USDG output and fee, then confirm the redemption path.

Same principle: show the conversion before the user commits.

Estimate is not execution

Reference values, displayed fees, and calculated outputs are illustrative until a live transaction is configured and executed. Market movement, liquidity, contract state, network conditions, and implementation details can change the final result.

LAUNCH AGAINST A BASKET, NOT A SINGLE STOCK.

A project token does not have to anchor its liquidity to one stock exposure. By pairing against a basket, the project gives its market one diversified reference asset and one balance to understand.

Why the pair matters

The quote asset shapes how a market is perceived. A project paired against one stock inherits a narrow reference. A project paired against \$AI7 can reference an AI hardware basket with a defined composition and one tradable balance.

01

quote asset to explain

04

AI references inside \$AI7

MARKET DESIGN

Composability is the point.

A basket is useful when another product can build around it without reproducing the underlying allocation from scratch.

“One basket gives a project a **single liquidity counterpart for a diversified exposure.”**

THE TOKEN IS THE FEE ENGINE.

Xindex does not lead with a token launch. It leads with products people can understand and use. If basket demand, vault activity, and liquidity pairs develop, a future project token can be introduced around the economic activity those products create.

01 / PRODUCT LAYER

Baskets are the product.

Build assets people genuinely want to hold, trade, and pair.

02 / REVENUE RAIL

Fees follow usage.

Mint, redeem, and future basket listing activity can support a transparent fee model.

03 / FUTURE TOKEN

Utility comes later.

A token can be tied to protocol fees and governance after the product foundation exists.

THE SEQUENCING PRINCIPLE

Do not launch the token first.

A token should not have to manufacture the reason the protocol exists. The baskets establish that reason. Adoption, useful liquidity, and vault volume provide the context for later utility.

Illustrative fee model

0.10%

WHAT FEES CAN SUPPORT

- ✓ Protocol operations and maintenance
- ✓ Basket listing and configuration work
- ✓ Future governance and token utility

The exact model is subject to implementation, governance, and applicable requirements.

“Product-market fit starts with assets people want to hold and pair against.”

TRUST STARTS WITH THE REFERENCE.

A basket product is only as understandable as the references beneath it. Xindex is designed around canonical Robinhood Stock Token references, explicit weights, and a clear distinction between a reference catalogue and executable liquidity.

Reference discipline

PRINCIPLE

MEANING FOR USERS

Canonical references

Basket components should point to the intended official catalogue entries, not lookalike proxies.

Visible composition

Weights and underlying names should be inspectable before a user chooses a basket.

Reference price clarity

Displayed values are reference estimates; they do not guarantee execution.

Separate liquidity proof

A listed reference and an executable market are related but distinct questions.

Non-custodial intent

The vault should not imply that Xindex takes custody of user assets.

A SIMPLE CONTRACT MAP

Reference

Basket definition

Vault / market

Each layer has a different job. The interface should not collapse them into one vague claim.

01

canonical reference layer

01

published basket definition

01

clear estimate-to-execution
boundary

What this does not mean

A tokenized stock reference is not the same as owning the underlying company share. It may provide economic exposure under the terms of its own instrument, without share ownership or voting rights. Users must review the applicable terms and restrictions.

BUILD IN PUBLIC. SHIP IN STAGES.

The sequence matters. Xindex should move from a clear product concept to verified implementation without letting the language of a prototype outrun the reality of the system.

- **PHASE 01 / PRODUCT CLARITY**

Define the initial catalogue

Finalize the basket names, intended compositions, reference entries, user flows, and disclosure language for \$AI7, \$MAG7, and \$GOLD.

- **PHASE 02 / CONTRACT READINESS**

Verify the conversion path

Implement and review the non-custodial vault path, pricing/reference boundaries, mint/redeem behavior, and fee accounting.

- **PHASE 03 / MARKET UTILITY**

Prove the pairing use case

Establish basket liquidity and demonstrate why new projects can use a basket as a practical counterpart.

- **PHASE 04 / FUTURE UTILITY**

Evaluate token economics

Only after product usage exists: assess a future fee-engine and governance token with a clear purpose.

KNOW THE LIMITS. DESIGN AROUND THEM.

A useful basket interface makes risk easier to inspect; it does not make risk disappear. The protocol path and public language should remain explicit about what can change.

Risks to understand

Underlying exposure risk

Basket diversification does not remove price movement or concentration risk inside a composition.

Liquidity and execution risk

Reference values may not equal the price available in a live market or redemption path.

Contract and oracle risk

Software, reference data, and external dependencies can fail or behave unexpectedly.

Instrument and jurisdiction risk

Tokenized references may have eligibility, transfer, geographic, or legal restrictions.

PROTOTYPE BOUNDARY

The current Xindex experience is frontend-only and includes simulated interactions. It is not a connected wallet, a live order router, or a completed on-chain protocol.

ONE BASKET. MORE WAYS TO USE IT.

Xindex starts with a simple product promise: make several tokenized stock exposures easier to hold, trade, and pair by composing them into one clear basket asset.

\$AI7

AI compute basket

\$MAG7

mega-cap technology basket

\$GOLD

gold-linked basket

Important disclosure. This concept paper is for informational purposes only and does not constitute financial, investment, legal, tax, or regulatory advice. It describes a product concept and a frontend simulation, not a live offer, solicitation, transaction, or guarantee. Basket compositions, weights, fees, reference values, availability, contract addresses, execution paths, and roadmap items may change. Tokenized stock references may provide economic exposure without share ownership or voting rights and may be subject to terms, restrictions, and jurisdictional limitations. Users should conduct their own review and consult qualified professionals before making decisions.
